

JWTGen project

Web Application functional test code generator

December 11th, 2006

Jérôme PETIT - [Mickaël BARON](mailto:mickaël.baron@serli.com)

SERLI Informatique

- SERLI : software and consulting company ~ 50 employees
 - Information systems
 - Embedded and real-time systems
 - Document management softwares

- Open Source philosophy

- Integrate Open Source components
- Contribute to the code, give conferences, write training courses

- Our contributions

- JaasLounge : JAAS interoperability for Java EE
- JASMINe, JShaft : Java EE cluster management
- JWT Gen : web application functional test generator

Summary of talk

- Context of this project
- JWT Gen project
- JWT Gen tool
- Roadmap
- Demonstration

Context of the JWT Gen project

- JWT Gen project targets the web applications
- Web applications are more and more used
- Web applications are more and more complex
 - New paradigms of interaction with the AJAX technologies
 - Interoperability for linking different web services
- Need to supply safe web applications
 - Reduce the bugs
 - Reduce the time of development of web applications
- **Solution** : integrate functional tests during the development process

Functional Test Tools

➤ Testing tool : implicit approach

- Record a sequence of user interactions (a trace of user interactions)
- Add new tests
- Test code is not available
- Tools : Mercury WinRunner, IBM Rational Robot, Borland Silk Test
- Not free

➤ Testing library : explicit approach

- Based on the xUnit API
- Need to write the test code
- Tools : *HTTPUnit, WebUnit, HTMLUnit*
- Free

htmlunit

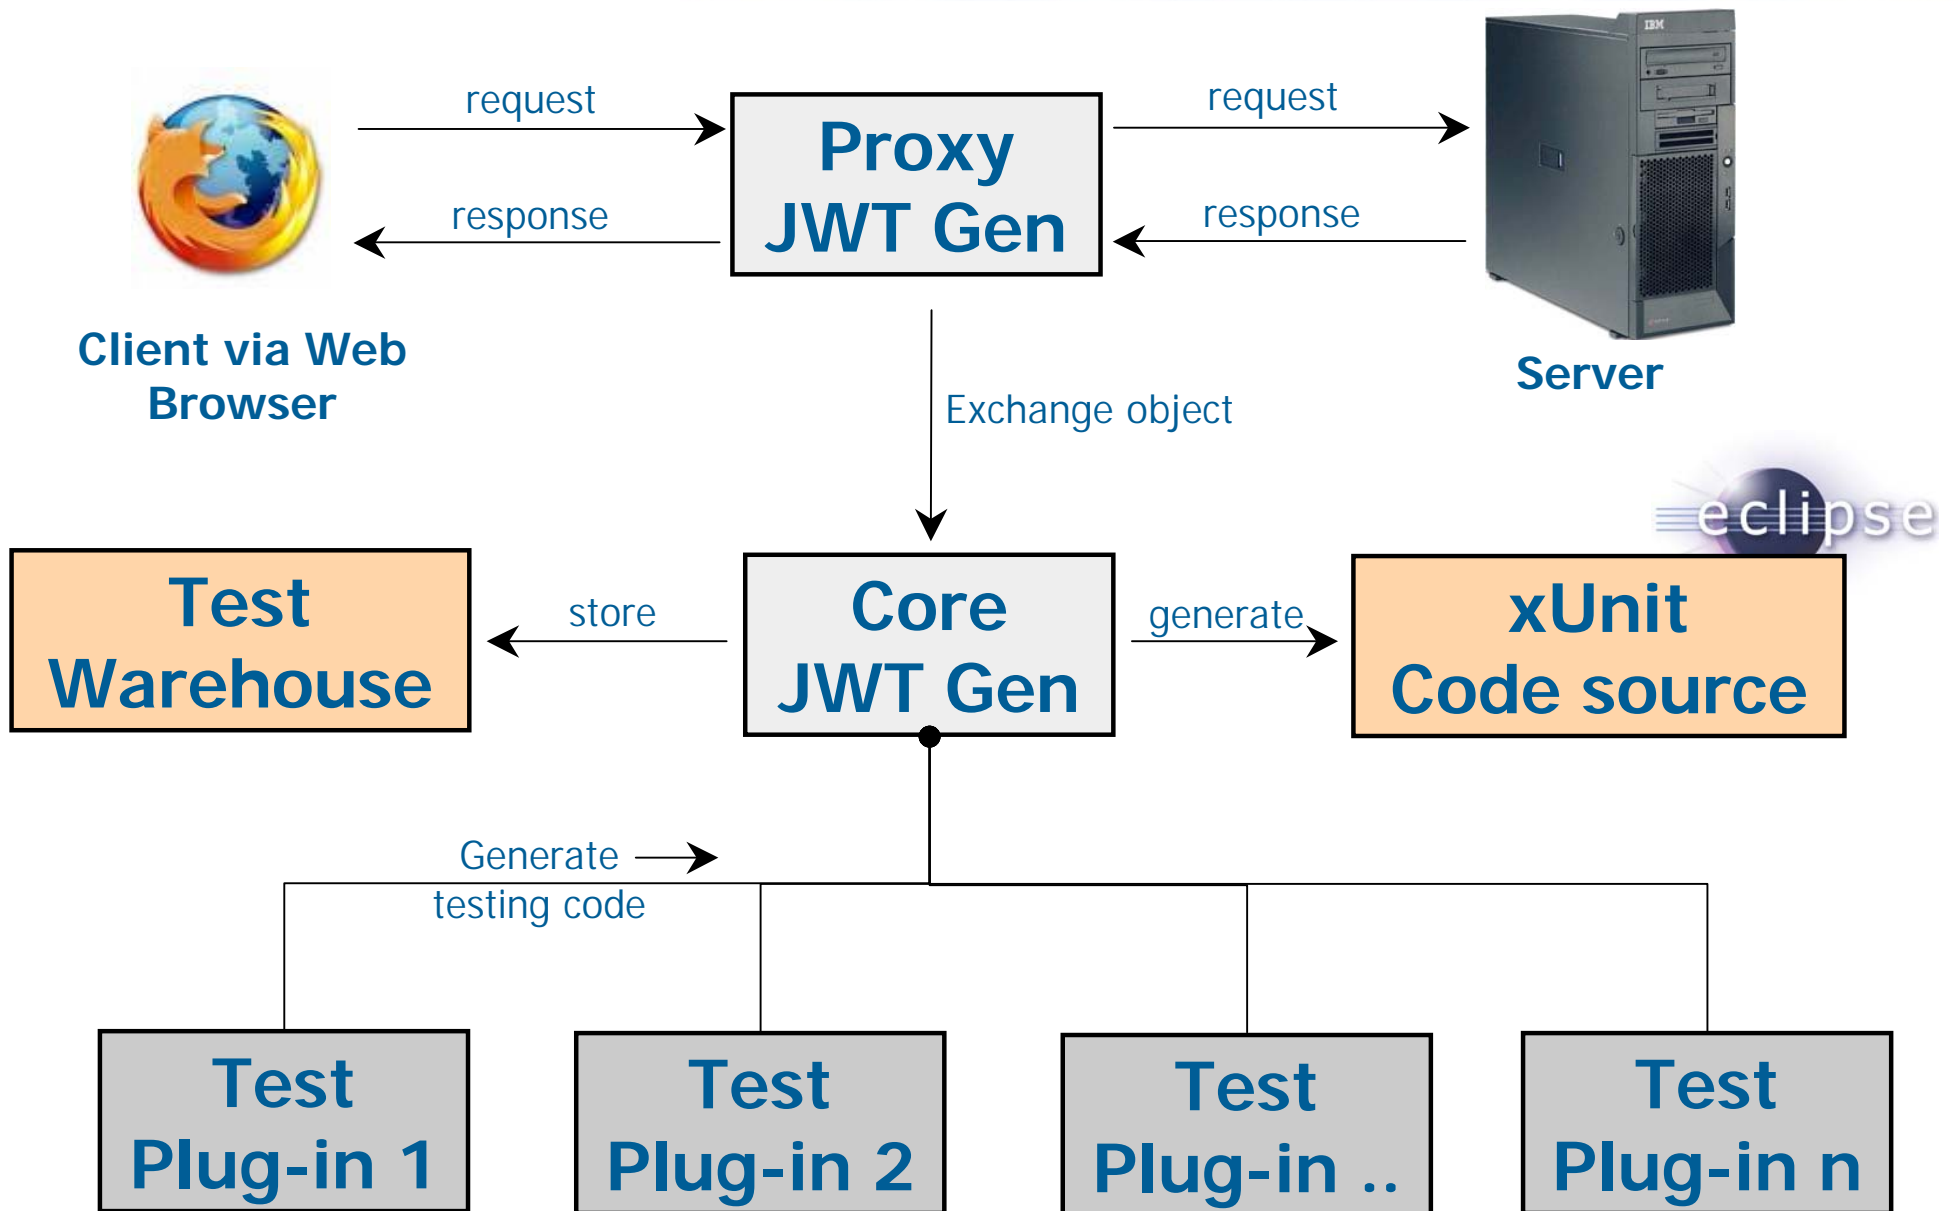

HttpUnit

JWebUnit

JWT Gen Approach

- JWT Gen : **J**ava **W**ebapp **T**est **G**enerator
- Reduce time and cost of functional test writing phase
- Open Source Components xUnit
- Supply an end-user tool to generate automatically xUnit tests
- Extensible project : add new testing functionality features
- Category of JWT Gen users
 - Web application developers
 - Web application testers

JWT Gen Approach

Proxy and Core modules features

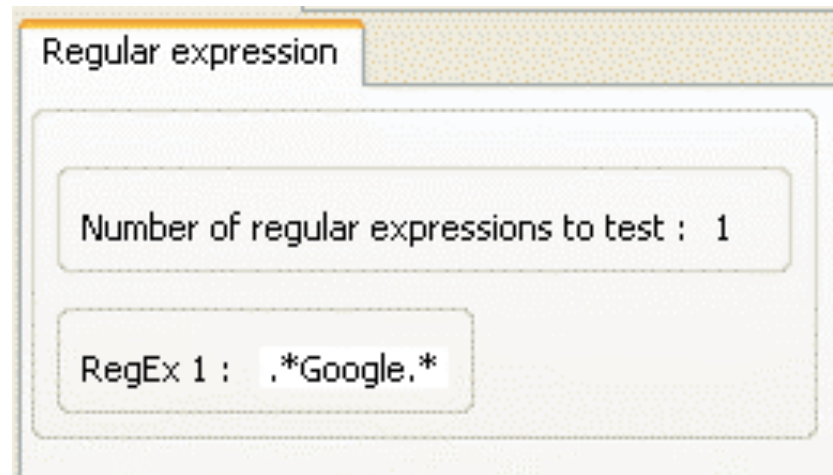

- Proxy : intercept requests and responses, generate exchange objects
 - A response can have different MIME types : HTML, CSS, GIF, PDF, ...
 - Need to configure the proxy in your browser to activate JWT Gen
 - No perturbation during the navigation entirely transparent
- Core : store exchange objects and tests
 - Determine which test plug-in can be used according to a specific MIME type (included in the response body)
 - Generate the code tests from plug-ins

Plug-in architecture

- Enhance the functionalities of JWT Gen by new plug-ins
- Plug-in characteristics
 - Supply an « user friendly » interface
 - Associate with one or more several xUnit library(ies)
 - Generate readable xUnit test code
- JWT Gen supplies already two plug-ins
 - Regular expression plug-in
 - HTML plug-in

Regular Expression plug-in

- Allow to define regular expressions on a specific exchange with text MIME types
- User interface for the regular expression plug-in

- Examples
 - `.*google.*` to search if the *google* string is present in the response
 - `<a href = \"*\?param1*` to search if param1 is used in links

HTML plug-in

- Define tests on a specific HTML web page
- Enable when the MIME type of the response is HTML
- User interface for the HTML plug-in

```
td valign="top" width="100%" bgcolor="#E8EAF0">

- &#160;
- a class="barre" href="http://consortium.objectweb.org/"
- &#160;&#160;
- a class="barre" href="http://solutions.objectweb.org/"
- &#160;Solutions&#160;
- &#160;&#160;
- a class="barre" href="http://middleware.objectweb.org/"
- &#160;&#160;
- a class="barre" href="http://forge.objectweb.org/"
- &#160;&#160;
- a class="barre" href="http://myobjectweb.objectweb.org/"
- &#160;&#160;&#160;
- a class="barre" href="http://v2.objectweb.org/"

```

HTML tree view

HTML renderer

➤ Examples

- Search a specific label into a web page
- Search a specific url into a web page
- Check if a specific link is existing with a specific label

JWT Gen tool

- Framework used : Eclipse Rich Client Platform
- Two deployment versions
 - Integrate JWT Gen into the IDE (plug-ins)
 - Supply a stand-alone application
- Eclipse architecture benefits
 - JWT Gen development based on a set of plug-ins
 - Eclipse architecture allows to add new plug-ins easily

Current JWT Gen prototype

- JWT Gen tool can test
 - Form-based web applications with idempotent httprequest
- JWT Gen tool cannot test yet ...
 - Web applications with specific containers (flash, applet)
 - Web applications with dynamic navigation scheme (generated links, AJAX)
- What is working ?
 - Proxy module with HTTP protocol
 - Core module (store exchange, manage plug-ins, store tests, ...)
 - Regular expression

Contributions

- Validation of the JWT Gen architecture
- JWT Gen user (developer and tester) validations
 - User interfaces functionalities
 - Test requirements
- New JWT Gen plug-ins ...
 - Plug-in to test the pdf files (PDFUnit)
 - Plug-in to test the content of images
- User manual

2007 Roadmap

- Handle HTTPS protocole
- Web applications including AJAX technologies (GWT, ...)
- New kinds of test plug-ins
- ...

Demonstration

- Configure web browser
- Launch proxy module
- Navigate in a local web site
- Define some tests with the regular expression plug-in
- Define some tests with the HTML plug-in
- Generate functional test code
- Play the tests

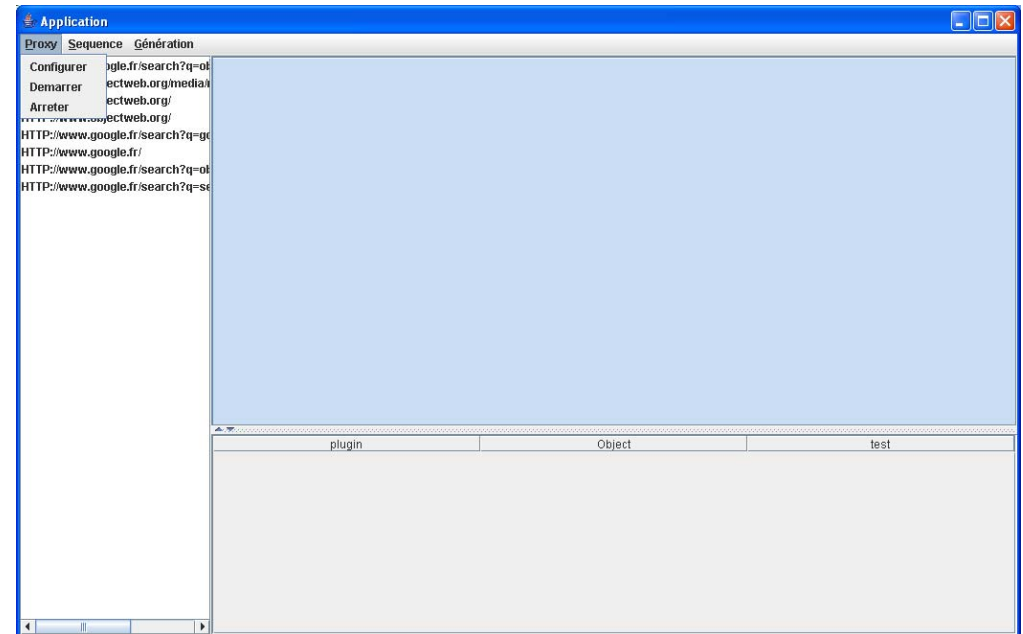

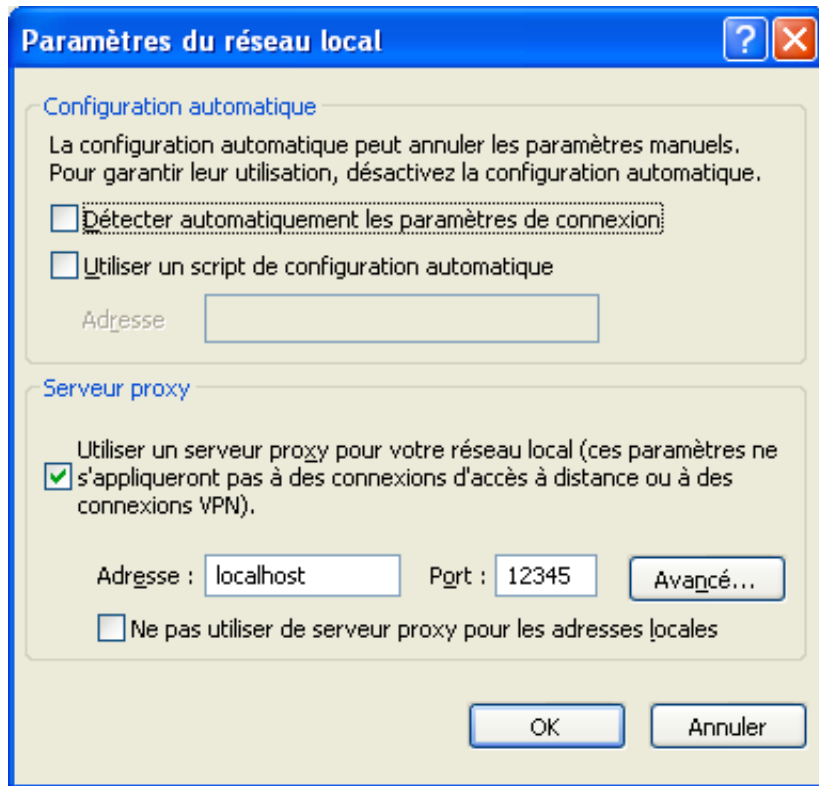

JWTGen project

Web Application functional test code generator

Démonstration : JWT Gen Swing

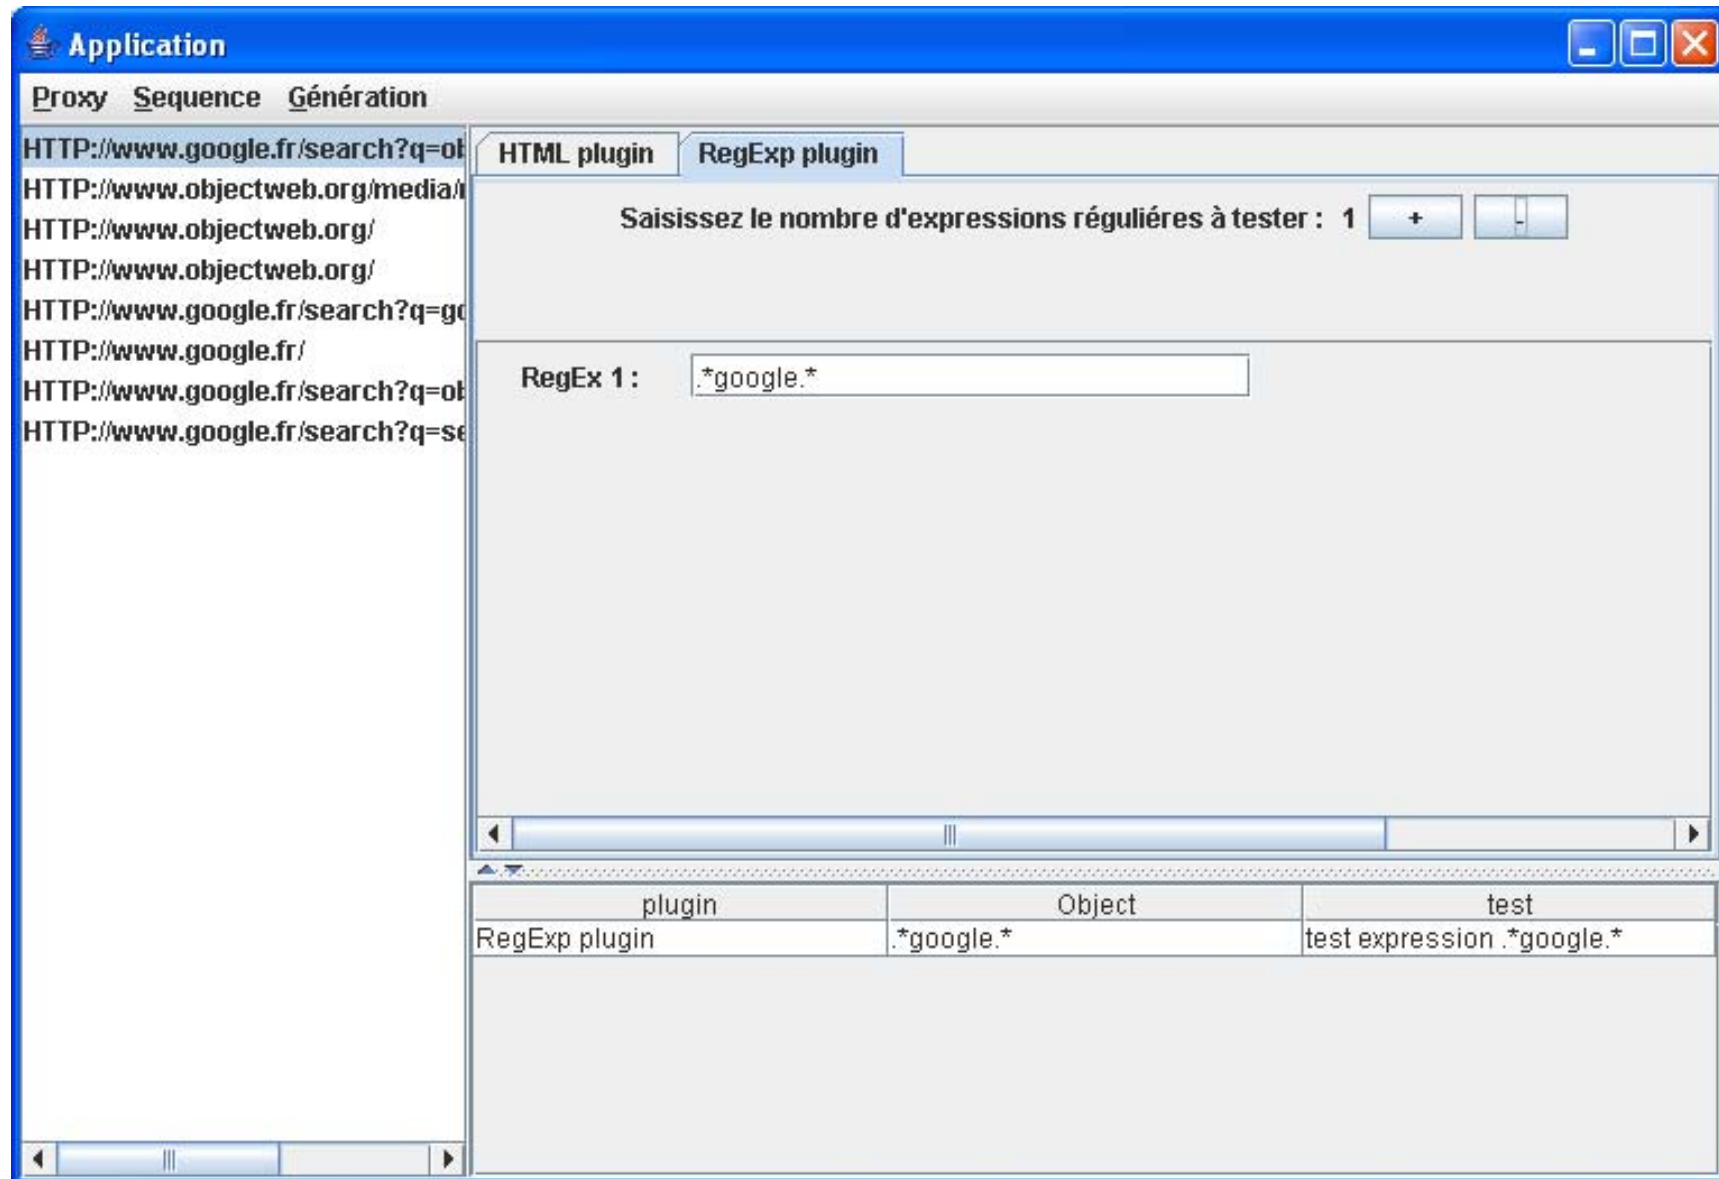

Demonstration : JWT Gen Swing

Demonstration : JWT Gen Swing

The screenshot shows a software application window titled "Application" with a menu bar containing "Proxy", "Sequence", and "Génération". Below the menu bar, a list of HTTP requests is visible, including several from "www.google.fr" and "www.objectweb.org". The main area is divided into two panes. The left pane, labeled "HTML plugin", displays a tree view of an HTML document structure with elements like "body", "title", "div", "script", "table", and "div". The right pane shows a rendered view of a search result page from Google.fr. The search query is "objectweb", and the results show "ObjectWeb - Home Page" as the top result. The page content includes a description of the ObjectWeb Consortium and links to various resources like "Software Downloads" and "Members".
